

**Security management
made easy.**

PHARMACY

Prevent theft, protect patient health records, and heighten the security of your pharmacy

Limit and audit access to controlled substances and patient health data. Receive automated emails and text message notifications in the event of intrusion or suspicious activity. Synchronize the access control system with your current alarm/video surveillance to record/bookmark video triggered by access time, alarm, or other specific event.

Keep track of employee schedules and monitor activity during shifts for payroll

Use ReachNet to track the daily store opening/closing times. Track when employees access the manager's office, storage room, and restrooms. Use the same screen to view all stores or a single location. Run daily, weekly, or monthly custom reports filtered by door, time, employee, etc.

Manage turnover and eliminate re-keying hassles and costs

When an employee leaves the company, or a new employee joins the staff, you can easily add, delete, or modify their privileges with a few mouse clicks. If the opening shift manager forgets their access card/code, automatically and remotely unlock the store.

Easily manage your system anytime and anywhere, so you can decrease IT costs

Managing the Reach Access Control System doesn't require access control knowledge, extensive training or support from your IT department. Whether you're at another location, at the corporate office, or even on the road, ReachNet is available to you 24 hours a day, 7 days a week, 365 days a year, anywhere you have internet access.

Ongoing support from your Managed Services Provider, as well as lifetime, automatic upgrades

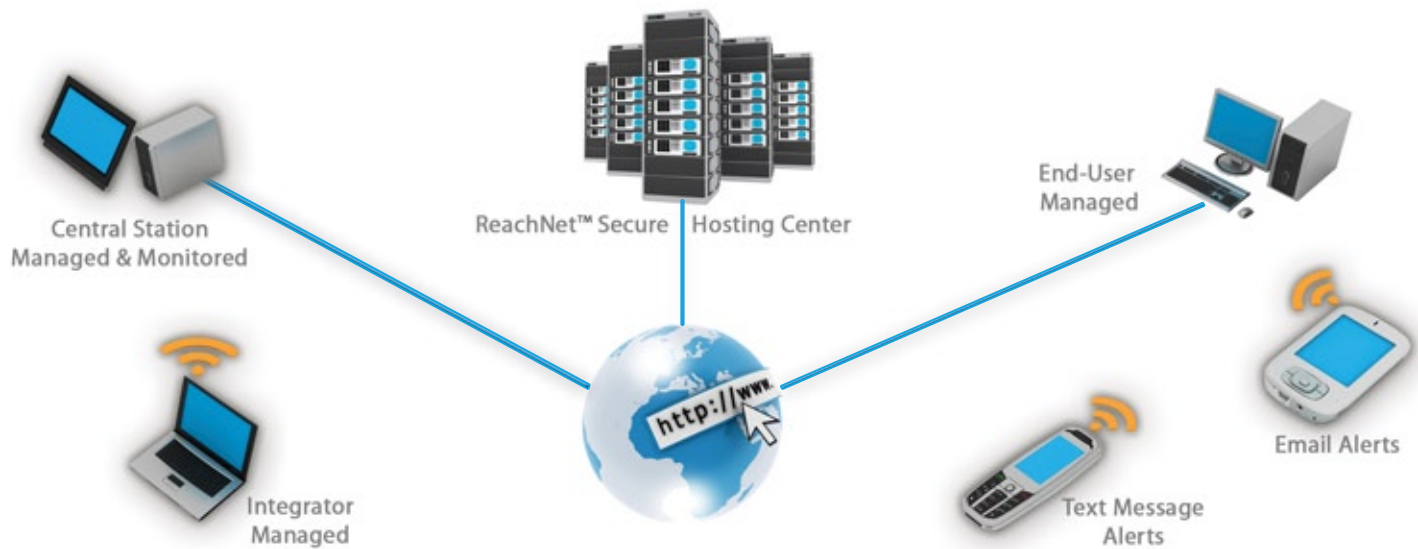

Unlike traditional access control systems, you choose who manages your system, through a Reach Systems Managed Services Provider. Your Managed Services Provider offers you a full spectrum of support services, including system administration, after hours monitoring, reporting, along with automatic upgrades and updates for the lifetime of the system.

The Reach Access Control Solution

The Reach Access Control System (ACS) is a keyless entry solution that is delivered as a web-hosted service. The system connects intelligent IP Controllers (Panels), via the open Internet to deliver a low cost, secure, enterprise class access control system, ideally suited to meet the needs of organizations with geographically dispersed locations.

The Reach ACS provides a convenient and cost-effective solution for organizations that want the benefits of comprehensive multi-site access control, without the up-front investment in computer hardware and software, or the ongoing cost for their IT staff to maintain it. With the Reach ACS, organizations can take control of access to their facilities, making them more secure, while reducing IT costs.

SYSTEM ARCHITECTURE

Our Managed Services approach provides a cost-effective solution for organizations that want the benefits of comprehensive access control management, without the investment of purchasing software and dedicated IT staff to maintain and support it.

Key Benefits include:

Web-based, intuitive User Interface is easy to learn and operate

Access to information anytime, anywhere

Service model mitigates technical obsolescence by eliminating local support of server and software - add-ons and upgrades are "delivered" automatically and pre-tested by the hosting service

Lower initial deployment costs

Lower total cost of ownership and predictable service costs make deployment of security more acceptable to corporate management

Remote hosted services transfer non-critical security functions and support services from the user to the Managed Services Provider

With ReachNet™, you get to spend more time managing your business and less time managing your security.
